

>>> INDUSTRY VISIT TO UTHM

3 DECEMBER 2025
Wednesday
UTHM

During the industry visit to the UTHM Data Center, we had the opportunity to experience the facility face-to-face. The purpose of the visit was to gather information to develop a more well-structured Enterprise Architecture (EA) for UTHM. Through this visit, we gained new knowledge about data center operations and how enterprise architecture integrates infrastructure, systems, and data to support organizational processes.

Technology

During the visit, we explored the infrastructure of the data center. UTHM is implementing both hot and cold containment-based environments to improve power efficiency. Besides, the data center follows the Tier 3 architecture to ensure operations remain uninterrupted during power outages. The data center receives dual power sources from TNB (PEA & PEB), use UPS as first power continuity, and generator (Genset) as backup power. Moreover, the Monitoring Room and Staging Room are used to monitor and configure the settings in data center. In addition, the data center is built upstairs of the building to prevent natural disaster like flood.

Furthermore, UTHM applies Enterprise Architecture (EA) to manage digital services including Total Campus Integrated System (TCIS), Learning Management System (LMS) and centralized student data systems. These systems are transitioning from older platforms into a fully integrated web-based environment that supports Single Sign-On (SSO) for easier access. Additionally, UTHM enforced the system security with dual firewalls from China and Europe along with Web Application Firewall (WAF) to protect portals and applications.

>>> REFLECTION (SYAHMI)

Through this visit, I learned how a data center operates and its role in supporting university systems, including the use of hot and cold aisle cooling for efficient temperature control. I also gained useful insights from UTHM current Enterprise Architecture (EA). Even though it is simple, it helped me better understand the structure and directly supported my project, which is based on UTHM existing EA.

>>> REFLECTION (FARRA)

The industrial visit to UTHM thought me on how they operate their data center using a proper technologies. It helped me better understand on how infrastructure, systems and data are managed to support their organizational activities. Moreover, the visit also show me the overview of UTHM's enterprise architecture (EA) that add on to my knowledge about EA.

>>> REFLECTION (CHUA)

From this visit, I gained valuable knowledge from the data center. I learned the differences of the cold and hot aisle environments. Besides, I also learned how the data center ensures operational continuity during unexpected events such as floods and power shortages. Overall, this visit enhanced my understanding of modern data center design and its role in supporting university operations.

>>> REFLECTION (NAIM)

From the visit, I gained a lot of knowledge about data centers, including how they work, the technologies used, and the requirements to build and manage a data center. I also learned about UTHM's Enterprise Architecture (EA), which gave me a clearer idea and inspiration on how to design a better and more effective EA.
