LECTURER: DR. AHMAD NAJMI BIN AMERHAIDER NUAR

1.0 Objective

The objective of this assignment is to develop a simple mobile application using Flutter that can record and manage daily activities. This project aims to apply basic Flutter concepts such as widget usage, user input handling, and displaying data using ListView. It also focuses on implementing state management using setState() to update the interface dynamically based on user actions. The aim is to gain a better understanding of building a simple and functional mobile application.

2.0 Brief description of the system

The Daily Activities Recorder App is a simple application that allows users to record their daily activities. Users can enter the name of an activity and its time or category. After entering the information, users can save the activity, and it will be displayed in a list on the screen.

The system is designed to be simple and does not use a database. All data is stored temporarily while the application is running. The main goal of this system is to demonstrate basic Flutter functionality and interaction between user input and the interface.

3.0 Explanation of the interface

3.1 Activity Input Field

The activity input field allows the user to enter the name of the activity. For example, the user can type “Study Flutter” or “Jogging”. This field is created using the ‘TextField’ widget and is connected to a controller to capture the input.

3.2 Time/Category Input Field

The time or category input field allows the user to enter additional information about the activity. For example, the user can enter a time such as “8:00 PM” or a category such as “Exercise”. This also uses a ‘TextField’ widget to receive user input.

3.3 Add Button

The “Add Activity” button is used to save the activity entered by the user. When the button is pressed, the ‘onPressed’ function is triggered, which calls the ‘setState()’ method. This method updates the list of activities and refreshes the interface to display the new data.

3.4 Activities List

The activities list displays all the activities that have been added by the user. It is implemented using the “ListView” widget. Each item in the list shows the activity name and its corresponding time or category. The list updates automatically whenever a new activity is added.

3.5 Delete Button

Each activity in the list includes a delete button. This button allows the user to remove an activity from the list. When pressed, the selected activity is deleted using the ‘setState()’ function, and the interface is updated immediately.

4.0 Screenshot of the App

Screenshot 1: Main Page (Initial empty state)

This image shows the initial state of the app with two empty ‘TextField’ widgets for input and a placeholder message indicating that no activities have been recorded yet.

5.0 Conclusion

In conclusion, the development of the Daily Activities Recorder App successfully demonstrates the practical application of Flutter basics, including layout design and user interaction. By implementing 'StatefulWidget' and the 'setState()' function, the app efficiently manages data flow from the 'TextField' inputs to a dynamic ListView for real-time updates. This project highlights how fundamental widgets can be combined to create a functional, user-friendly interface that allows for the seamless recording and deletion of daily activities.
